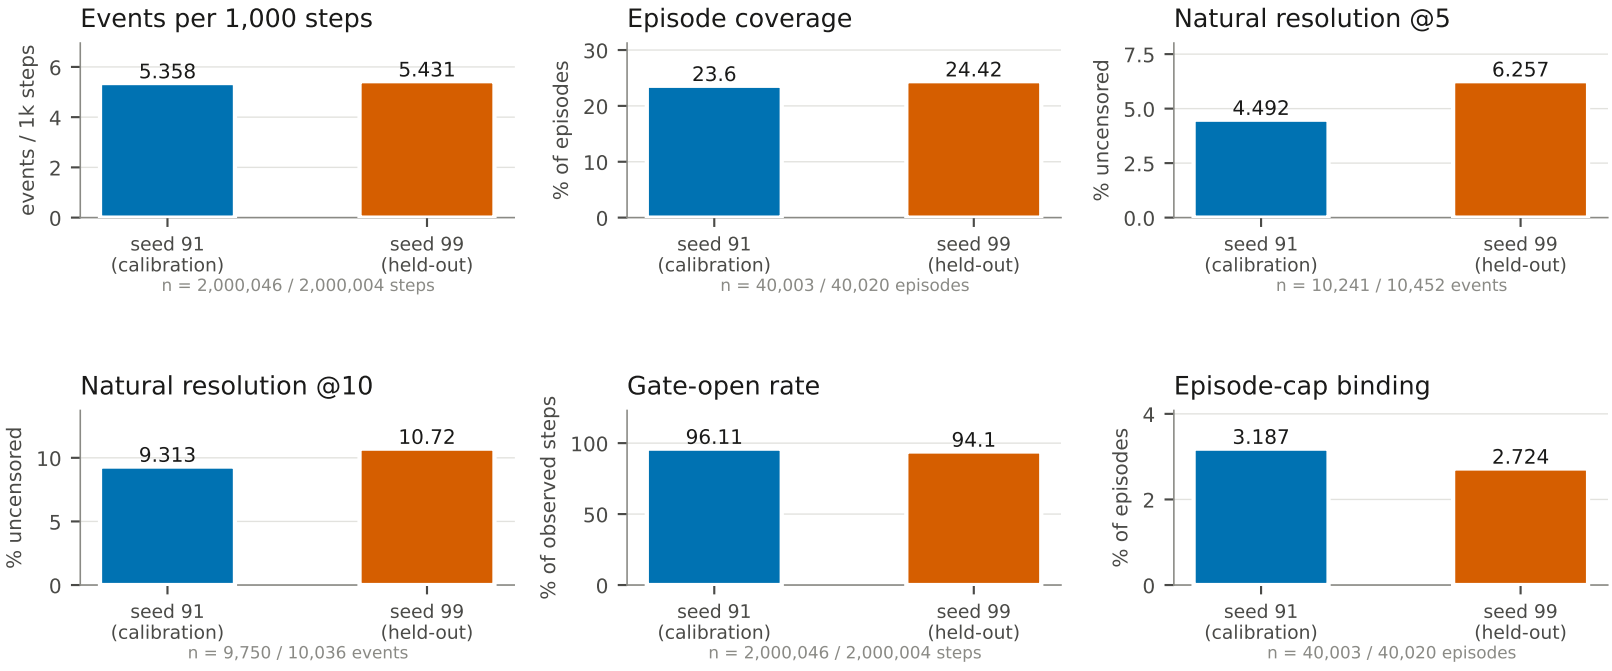
Frozen detector wf15_m3_t5_ibon: calibration seed vs held-out seed, identical 8×8-2p-2f-coop condition



Each panel has its own y-axis and unit — panels are never combined on a shared scale. Descriptive comparison only: one run per seed, so no significance is claimed and no p-values are reported. Natural resolution is a proxy for potentially unnecessary triggering, not a ground-truth false-positive rate.
