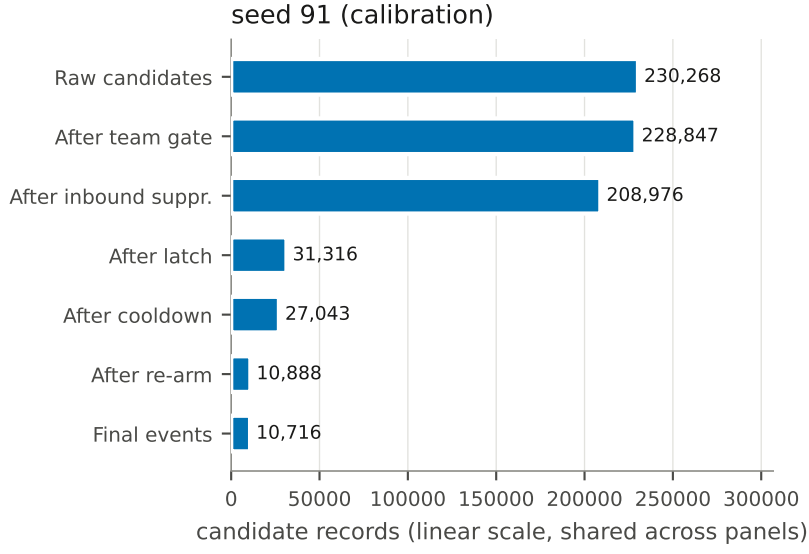
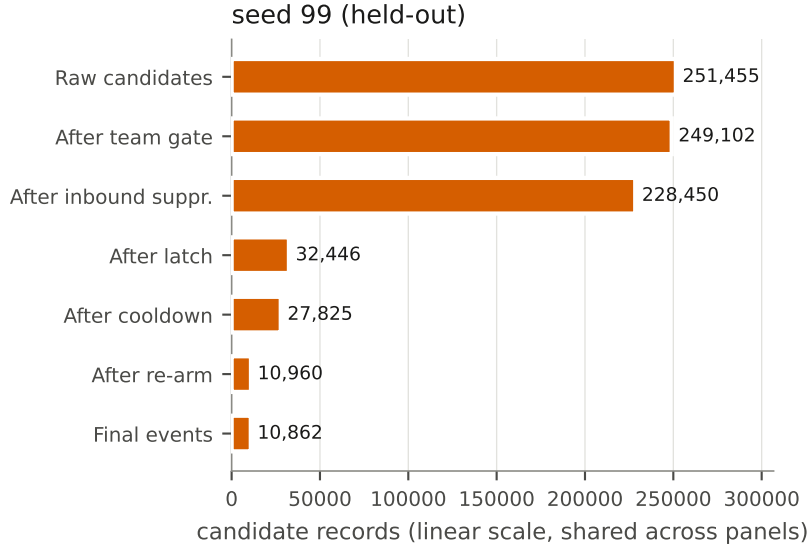
Detector candidate → event suppression funnel, frozen configuration wf15_m3_t5_ibon, 8×8-2p-2f-coop





Stages follow the implemented suppression ledger: raw_candidates − team gate → − inbound → − latch → − cooldown → − re-arm → − budget = final_events.
same_food_coalesced is 0 on both seeds, so no coalescing step is shown. Both panels share one common x-scale (0–300,000), so bar lengths are directly comparable between seeds.
